TORREY HILLS SCHOOL STUDENT DIAGNOSED WITH WHOOPING COUGH

An 11-year-old student who attends Torrey Hills School in the Del Mar Union School District, has been diagnosed with pertussis, commonly known as whooping cough. The student had 5 DTap shots and was due for their Tdap booster shot.

The San Diego County Health and Human Services Agency is working closely with school staff to notify the parents of all students who attend the school.

Named for the "whoop" sound children and adults sometimes make when they try to breathe in during or after a severe coughing spell, whooping cough usually starts with flu-like symptoms, such as runny nose, sneezing, fever and a mild cough. These symptoms may be mild and brief, or last up to two weeks, but are often followed by severe coughing fits that may be associated with vomiting. Fever, if present, is usually mild. It is treatable with antibiotics.

Whooping cough can occur at any age, but infants and young children are at highest risk of life-threatening complications, the most common of which is pneumonia. In adolescents and adults, rib fractures and difficulty sleeping may occur. Anyone who is not immunized is at a higher risk for severe whooping cough.

It is recommended that children get five doses of DTaP vaccine, one dose at 2 mo., 4 mo., 6 mo., 15-18 mo., and 4-6 years of age. It is also recommended that people 11- 64 years of age receive a one-time dose of Tdap, given in place of a "tetanus booster," which is administered every 10 years. No vaccine provides 100 percent protection against infections, but if a person does get the disease after being vaccinated it is often less severe.

There have been 103 cases of whooping cough in San Diego County this year. In 2008, there were 51.

For more information about whooping cough, please call the HHS Immunization Branch at (619) 692-8661, or visit the web site at www.sdiz.org.
